AI Powered BMS Software Layer

Unlocking the full potential of batteries

Better Performance

Eatron **Advanced SOX** algorithms offers best-in-class accuracy to extract maximum performance in complete safety.

Extended Lifetime

Patented approach to predicting **Remaining Useful Life** based on usage to extend battery life.

Increased Safety

AI diagnostic enables early detection of cell degradation and faults, increasing safety and reducing downtime.

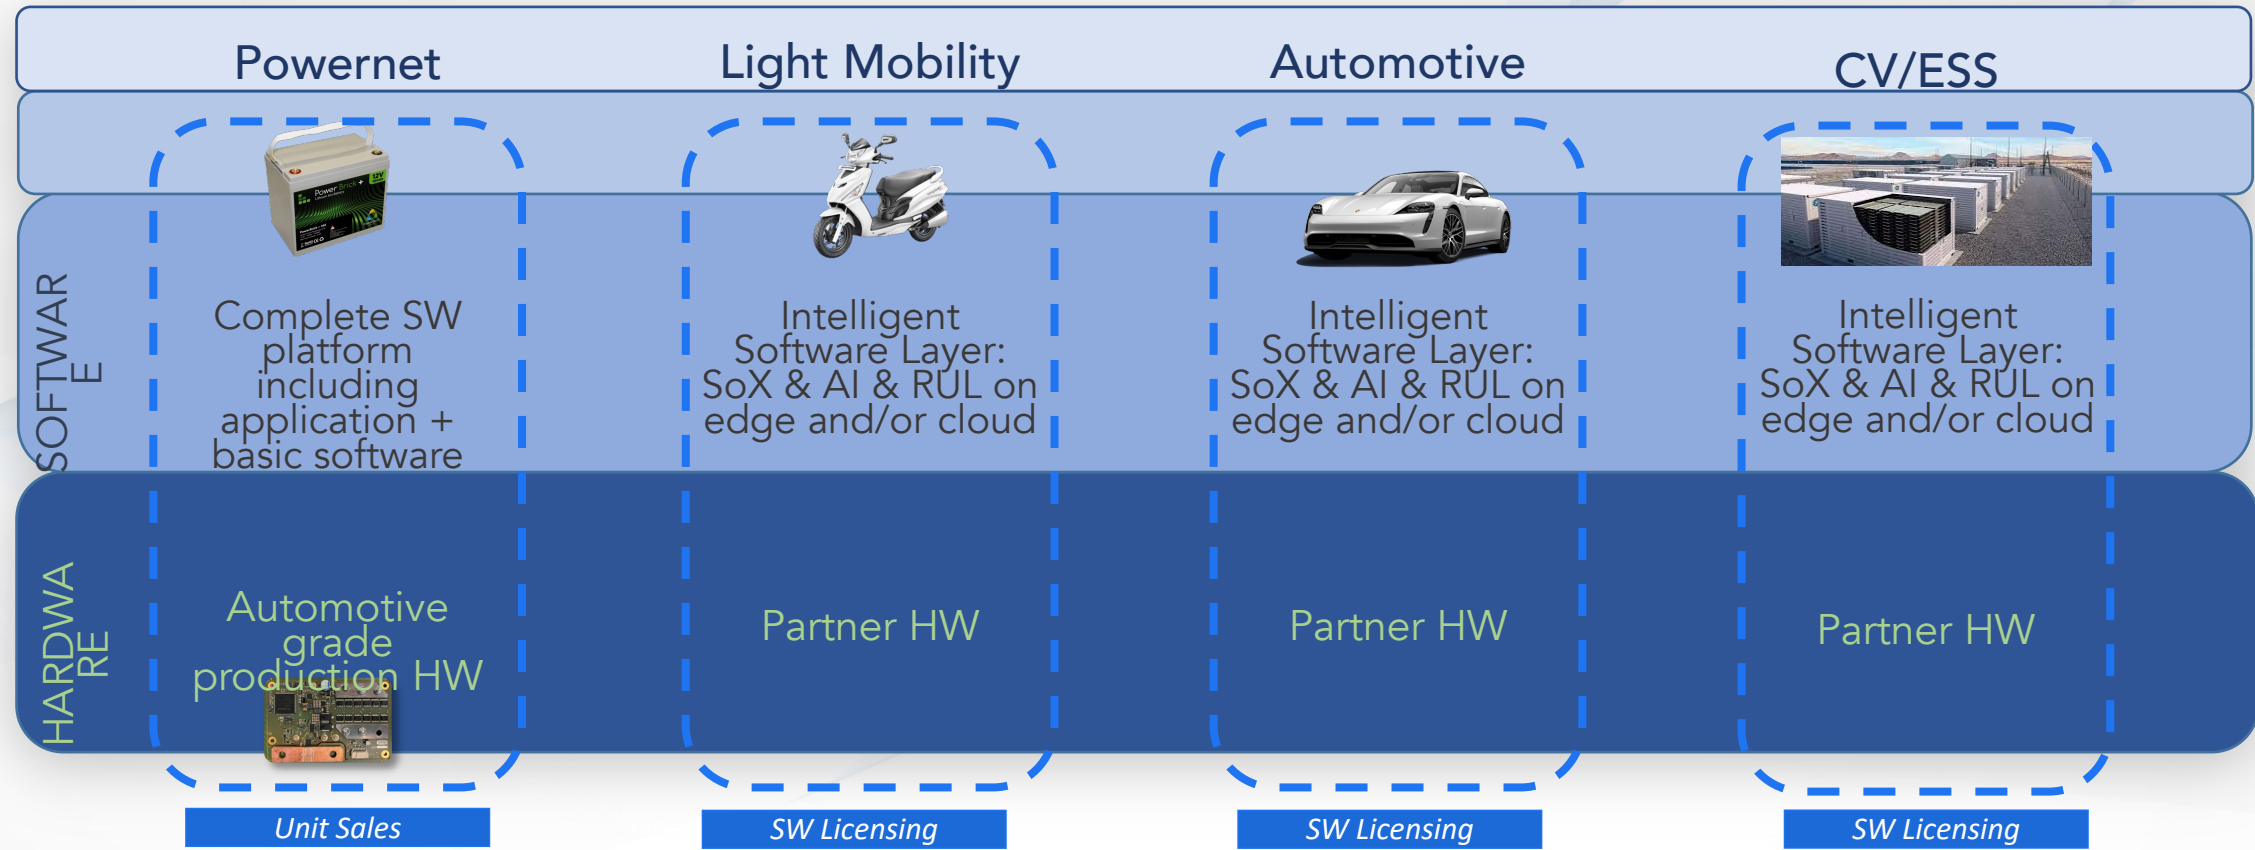

Edge-Cloud Integration :

Eatron algorithms can be easily integrated in the edge **and/or** in the cloud to achieve optimal performance

Eatron end-to-end software layer enables up to 10% more range and 20+% longer life

Product Portfolio

SOC performance

- Consistent SoC accuracy of $\pm 1.0\%$ achieved across the design temperature range at both cells BOL and EOL.
- Targeted SoC accuracy is retained throughout the battery lifetime despite the changes in cells' capacity/impedance.

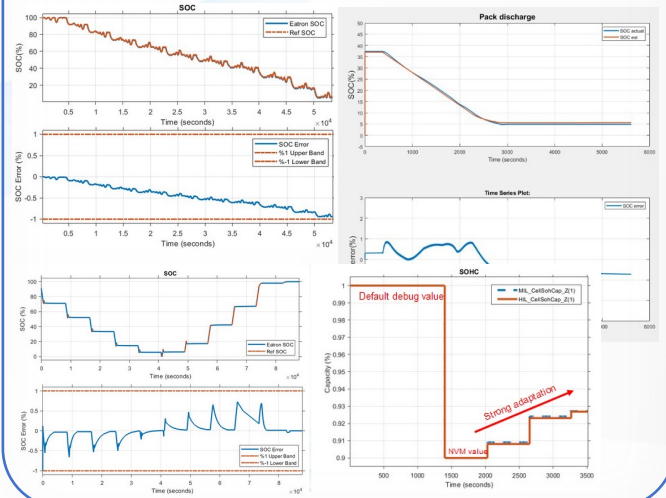

SOH performance

- Consistent Capacity-SoH accuracy of $\pm 2.0\%$ achieved across the lifetime of the cell.
- Rapid convergence (within 40min drive cycle)
- Improved accuracy of power limit estimation in high power applications.

Track Record across Different Chemistries & Applications

- Consistently better than existing solution on several customer applications:
- NMC
- LFP
- LTO
- Traction Batteries (HV / 48V)
- Powernet Batteries (12V / 24V)

Best-in-class SOC accuracy: 1% vs. 3% industry benchmark

US Patent Granted

SOH Forecast & RUL Prediction

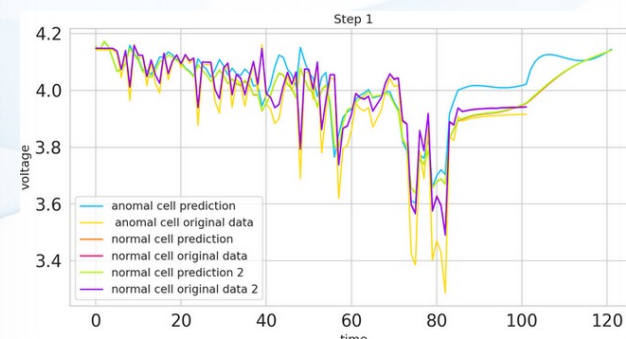

- SOH trajectory solution learns and predicts aging knee points
- Patented hybrid Remaining Useful Life prediction algorithm powered by AI and electrochemical model
- Dynamic prediction of remaining battery life depending on real world usage

US Patent Pending

Advanced Diagnostics

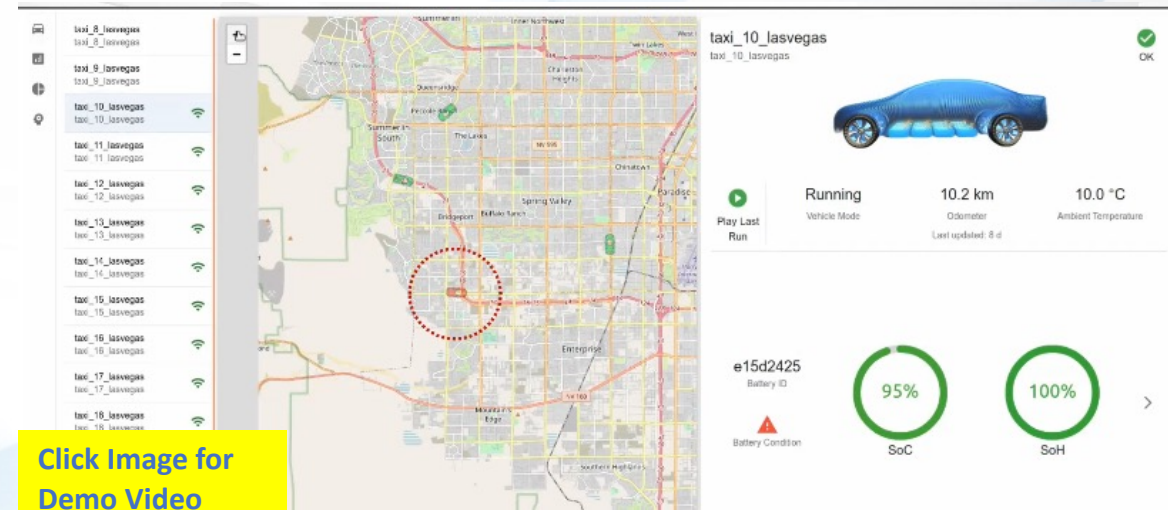

- Cell anomaly** detection algorithm by neural cell model enables detection of cell failures and thermal runaway weeks in advance.
- Lithium plating** detection by proprietary feature extraction achieving 0 false positive rate and 90% accuracy.

**SOH accuracy < 1% and RUL accuracy < 80 cycles**

Customer Benefits:

- **Better Performance**
 - Proprietary Patented Models for best-in-class accuracy
 - Edge / Cloud integration for optimal performance
- **Faster time to market**
 - Proprietary AI pipelines
 - Proprietary Model Parametrizations methods
 - Cloud Infrastructure Available
- **Cost Benefit**
 - Minimum upfront investment
 - Volume based subscription model enabling economies of scale
- **Maintain Competitive Edge**
 - Benefit from Eaton continuous investment in its software platform and learnings from growing number of batteries in the field
 - Access to a team of Battery, Software and AI Experts without the overheads.

Real time insights on battery performance in the field:

Dynamic prediction of Battery life depending on Usage

Technology Drivers & Needs

- **L3 ADAS** (Highly automated driving) is enabled by electric systems like steering and braking
- During driving the main source of power comes from DC/DC converter, but when it fails, the LV battery is the redundant power source to safely bring the vehicle to a stop
- Traditional 12V Lead Acid batteries are not suitable for **safety critical** applications

Solution

LV Li-ion battery with complex **highly safety assured BMS**

Application:

- LV Powernet safety critical batteries ASIL C(D)

Hardware:

- Design optimized for cost and high-volume production
- 12V-48V Scalable architecture

Software:

- Vector AUTOSAR stack
- Platform ASW customized to a specific OEM
